Atmel LED Driver-MSL2162

16-string White and RGB LED Driver with Adaptive Configuration, EEPROM, and SPI Bus

Datasheet Brief

Atmel LED Driver-MSL2162

16-string White and RGB LED Driver with
Adaptive Configuration, EEPROM, and SPI Bus

General Description

The Atmel LED Driver-MSL2162 compact, high-power LED string driver uses external current control MOSFETs to sink up to 350mA per string, with current accuracy and matching better than 1.5%. The MSL2162 drives 16 parallel strings of LEDs, and offers fault detection and management of open and short circuit LEDs.

The MSL2162 features a 20 MHz SPI bus that supports video frame-by-frame LED string intensity control for up to eight interconnected devices. Frame-by-frame control allows active area dimming and phase shifted PWM timing for improved backlight performance. The advanced PWM engine synchronizes PWM dimming to the video signals for reduced motion blur and waterfall noise.

The MSL2162 adaptively controls the DC-DC converters powering the LED strings, using Atmel efficiency optimizers to minimize power use while maintaining LED current accuracy.

A unique combination of regulation current control and pulse width dimming management offers simple, full-screen brightness control, versatile area dimming, and a consistent white point. A current sense resistor sets LED current for each string, offering the flexibility to drive each string with a different current. 8-bit control adjusts LED current equally for all 16 LED strings. Separate 12-bit registers control individual string pulse width dimming.

The MSL2162 monitors LED strings for open circuit, short circuit, loss-of-video-sync, and over-temperature faults, and provides a hardware fault output to notify a microcontroller. Use the serial interface for detailed fault status and control. Additionally, the MSL2162 includes on-chip EEPROM that allows customization of the power-up defaults, accessible through the serial interface.

The MSL2162 is packaged in a 9 x 9 x 0.85mm, 64-lead TQFN, and operates over a -40°C to 105°C temperature range.

Applications

Long Life, Efficient LED Backlighting for:

- Televisions and Desktop Monitors
- Medical and Industrial Instrumentation
- Automotive Audio-visual Displays

Channel Signs

Architectural Lighting

Atmel LED Driver-MSL2162

16-string White and RGB LED Driver with Adaptive Configuration, EEPROM, and SPI Bus

Key Features

- 12-bit PWM String Dimming Control

- Fast 20MHz SPI Bus Supports up to Eight MSL2162s per SPI Bus Chip Select

- 8-bit Adaptive Power Correction Maximizes System Efficiency by Controlling up to Two Power Supply Voltages

- External Current Control MOSFETs for High Voltage and/or Current

- Drives up to 16 Parallel LED Strings per Device

- Supports Adaptive, Real-time Area Dimming for Highest Dynamic Range LCD TVs and Monitors

- Programmable String Phase Reduces Motion Blur and Improves Efficiency

- Global Intensity Control via Serial Interface

- ±1.5% Current Accuracy and Current Balance

- Flexible Video Frame (VSYNC) and Line (HSYNC) Sync Includes Frequency Multipliers and Dividers

- Second Set of PWM Registers Allows Alternate Brightness and Timing Selection with a Single Control

- EEPROM Saves Power-on Default Settings

- LED Open Circuit and Short Circuit Fault Detection

- Individual Per-String Fault Detection Enable

- Over-temperature Shut-off Protection

- Broadcast Write Simplifies Configuration

- -40°C To +105°C Operating Temperature Range

Application Circuit
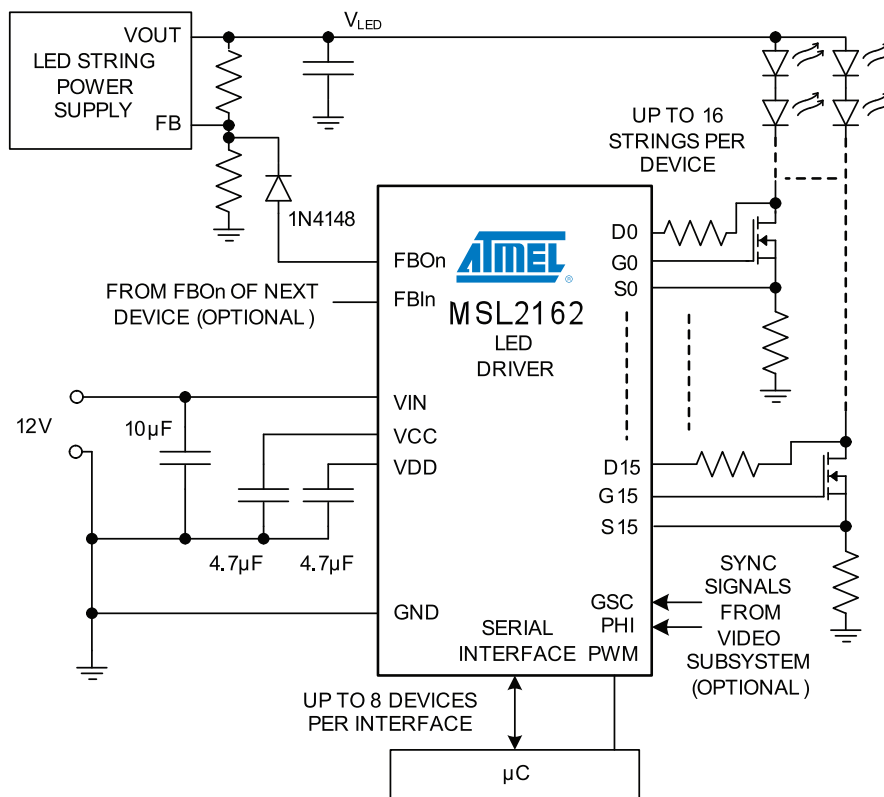

Quick Start Guide

The MSL2162 LED string controller drives, monitors, and dims multiple LEDs at high efficiency for LCD backlighting and signage applications. This section summarizes the capabilities of the MSL2162 for quick evaluation.

How Many LEDs and Drivers?

The MSL2162 controls 16 strings of series-connected LEDs at up to 350mA per string. Up to eight MSL2162s share a serial interface. The maximum number of LEDs per string is determined by the maximum power supply voltage, the LED forward voltage drop (V_F), and the gate drive outputs of the MSL2162. The MSL2162 FET gate drive outputs are optimized for FETs requiring up to 10nC of charge.

LED Power Supplies and Efficiency Optimizers (EOs)

The MSL2162 Efficiency Optimizer (EO) circuits dynamically adjust up to two LED string power supplies to the minimum voltage necessary to accurately drive the LED strings while assuring accurate current flow. The power supplies can use any topology, and are typically DC-DC boost or buck, or AC-DC off-line switcher supplies. The EOs rely on close matching of the LED strings connected to a string supply. The better the matching, the better is the overall efficiency. Multiple devices easily link together to optimize a single power supply.

Timing, PWM, Intensity Controls, and Synchronization

For video applications, the PWM LED drive signals synchronize to the LCD's video frame timing via the PHI input, and to the LCD's pixel timing via the GSC input. This synchronization eliminates beating artifacts. Suitability for LED backlight architectures is shown in Table 1. Area LED dimming for direct backlighting is supported for contrast and color gamut improvement. Motion blur is reduced by setting each LED string's PWM phasing individually to synchronize PWM off-times with the LCD update timing.

The MSL2162 also includes easily controlled internal PWM timing generation for standalone (non-video) LED lighting applications that do not provide external timing sources. One MSL2162 simply generates PWM timing for itself, and for the other devices in a multiple device application. Optionally, a single external PWM signal applied to the PWM input controls all of the strings on-times, with automatic progressive phase delay available through a single control bit.

Table 1. LED Common Backlight Drive Architectures and Features

BACKLIGHT TYPE	MOTION BLUR REMOVAL	AREA DIMMING MANAGEMENT	STRING SUPPLY OPTIONS
White LED - bottom edge-Lit	No	No	Up to two Efficiency Optimized power supplies
White LED - top/bottom edge-Lit	No	No	
White LED - 4 sides edge-lit	No	No	
White LED - direct back-lit	Yes, LED string phasing	Higher contrast ratio (area dimming)	
RGB LED - direct back-lit	Yes, LED string phasing	Higher contrast ratio and color gamut	Two Efficiency Optimized power supplies

Table 2. Timing and LED Intensity Control Capability

LED INTENSITY CONTROL	RESOLUTION
Global LED string current adjust	8-bit DAC reduces string current globally from maximum set external resistors
Global LED string PWM	8-bit global PWM control
Individual LED string PWM	12-bit PWM individual string control
Total LED string PWM control	12-bit LED String PWMs, computed from global and individual PWM settings

Package Connection Description

Table 3. Atmel LED Driver–MSL2162 Connection Description

NO.	NAME	DESCRIPTION
1	G4	**Gate output 4** Gate drive output for external MOSFET 4. Connect G4 to the gate of the external MOSFET driving LED string 4.
2	D4	**Drain sense input 4** Drain sense input for external MOSFET 4. Connect D4 through a 10MΩ resistor to the drain of the external MOSFET driving LED string 4.

Table 3. Atmel LED Driver-MSL2162 Connection Description

NO.	NAME	DESCRIPTION
3	S5	**Current sense input 5** Current sense input for LED string 5. Connect S5 to the source of the external MOSFET and to the current sense resistor for LED string 5. The full-scale LED current threshold is 500mV is across the current sense resistor.
4	G5	**Gate output 5** Gate drive output for external MOSFET 5. Connect G5 to the gate of the external MOSFET driving LED string 5.
5	D5	**Drain sense input 5** Drain sense input for external MOSFET 5. Connect D5 through a 10MΩ resistor to the drain of the external MOSFET driving LED string 5.
6	S6	**Current sense input 6** Current sense input for LED string 6. Connect S6 to the source of the external MOSFET and to the current sense resistor for LED string 6. The full-scale LED current threshold is 500mV is across the current sense resistor.
7	G6	**Gate output 6** Gate drive output for external MOSFET 6. Connect G6 to the gate of the external MOSFET driving LED string 6.
8	D6	**Drain sense input 6** Drain sense input for external MOSFET 6. Connect D6 through a 10MΩ resistor to the drain of the external MOSFET driving LED string 6.
9	S7	**Current sense input 7** Current sense input for LED string 7. Connect S7 to the source of the external MOSFET and to the current sense resistor for LED string 7. The full-scale LED current threshold is 500mV is across the current sense resistor.
10	G7	**Gate output 7** Gate drive output for external MOSFET 7. Connect G7 to the gate of the external MOSFET driving LED string 7.
11	D7	**Drain sense input 7** Drain sense input for external MOSFET 7. Connect D7 through a 10MΩ resistor to the drain of the external MOSFET driving LED string 7.
12	MISO	**Master input, slave output** MISO is the MSL2162 SPI bus data output.
13	MOSI	**Master output, slave input** MOSI is the MSL2162 SPI bus data input.
14	SCK	**SPI serial shift clock** SCK is the MSL2162 clock input for the SPI bus.

NO.	NAME	DESCRIPTION
15	CSB	**Chip select bar** CSB is the MSL2162 SPI bus chip select input for SPI transactions. Drive CSB low to enable serial interface communication.
16	FLTB	**Fault indication output (active low)** Open drain output FLTB sinks current to ground whenever the MSL2162 detects and verifies a fault. FLTB remains low until the fault registers are read, and reasserts if the fault persists.
17	ADDR	**Slave ID selection inputs** Connect ADDR to ground through a resistor to set the SPI bus address.
18	FBO2	**Efficiency Optimizer output 2** Connect FBO2 to the second power supply's feedback node. Connect FBO2 to ground if unused.
19	FBI1	**Efficiency Optimizer input 1** Connect FBI1 to FBO1 of the next device when connecting MSL2162s in series. If unused connect FBI1 to ground.
20	FBO1	**Efficiency Optimizer output 1** Connect FBO1 to the first power supply's feedback node. Connect FBO1 to ground if unused.
21	S8	**Current sense input 8** Current sense input for LED string 8. Connect S8 to the source of the external MOSFET and to the current sense resistor for LED string 8. The full-scale LED current threshold is 500mV is across the current sense resistor.
22	G8	**Gate output 8** Gate drive output for external MOSFET 8. Connect G8 to the gate of the external MOSFET driving LED string 8.
23	D8	**Drain sense input 8** Drain sense input for external MOSFET 8. Connect D8 through a 10MΩ resistor to the drain of the external MOSFET driving LED string 8.
24	S9	**Current sense input 9** Current sense input for LED string 9. Connect S9 to the source of the external MOSFET and to the current sense resistor for LED string 9. The full-scale LED current threshold is 500mV is across the current sense resistor.
25	G9	**Gate output 9** Gate drive output for external MOSFET 9. Connect G9 to the gate of the external MOSFET driving LED string 9.
26	D9	**Drain sense input 9** Drain sense input for external MOSFET 9. Connect D9 through a 10MΩ resistor to the drain of the external MOSFET driving LED string 9.

NO.	NAME	DESCRIPTION
27	S10	**Current sense input 10** Current sense input for LED string 10. Connect S10 to the source of the external MOSFET and to the current sense resistor for LED string 10. The full-scale LED current threshold is 500mV is across the current sense resistor.
28	G10	**Gate output 10** Gate drive output for external MOSFET 10. Connect G10 to the gate of the external MOSFET driving LED string 10.
29	D10	**Drain sense input 10** Drain sense input for external MOSFET 10. Connect D10 through a 10MΩ resistor to the drain of the external MOSFET driving LED string 10.
30	S11	**Current sense input 11** Current sense input for LED string 11. Connect S11 to the source of the external MOSFET and to the current sense resistor for LED string 11. The full-scale LED current threshold is 500mV is across the current sense resistor.
31	G11	**Gate output 11** Gate drive output for external MOSFET 11. Connect G11 to the gate of the external MOSFET driving LED string 11.
32	D11	**Drain sense input 11** Drain sense input for external MOSFET 11. Connect D11 through a 10MΩ resistor to the drain of the external MOSFET driving LED string 11.
33	S12	**Current sense input 12** Current sense input for LED string 12. Connect S12 to the source of the external MOSFET and to the current sense resistor for LED string 12. The full-scale LED current threshold is 500mV is across the current sense resistor.
34	G12	**Gate output 12** Gate drive output for external MOSFET 12. Connect G12 to the gate of the external MOSFET driving LED string 12.
35	D12	**Drain sense input 12** Drain sense input for external MOSFET 12. Connect D12 through a 10MΩ resistor to the drain of the external MOSFET driving LED string 12.
36	S13	**Current sense input 13** Current sense input for LED string 13. Connect S13 to the source of the external MOSFET and to the current sense resistor for LED string 13. The full-scale LED current threshold is 500mV is across the current sense resistor.
37	G13	**Gate output 13** Gate drive output for External MOSFET 13. Connect G13 to the gate of the external MOSFET driving LED string 13.

NO.	NAME	DESCRIPTION
38	D13	**Drain sense input 13** Drain sense input for external MOSFET 13. Connect D13 through a 10MΩ resistor to the drain of the external MOSFET driving LED string 13.
39	S14	**Current sense input 14** Current sense input for LED string 14. Connect S14 to the source of the external MOSFET and to the current sense resistor for LED string 14. The full-scale LED current threshold is 500mV is across the current sense resistor.
40	G14	**Gate output 14** Gate drive output for external MOSFET 14. Connect G14 to the gate of the external MOSFET driving LED string 14.
41	D14	**Drain sense input 14** Drain sense input for external MOSFET 14. Connect D14 through a 10MΩ resistor to the drain of the external MOSFET driving LED string 14.
42	S15	**Current sense input 15** Current sense input for LED string 15. Connect S15 to the source of the external MOSFET and to the current sense resistor for LED string 15. The full-scale LED current threshold is 500mV is across the current sense resistor.
43	G15	**Gate output 15** Gate drive output for external MOSFET 15. Connect G15 to the gate of the external MOSFET driving LED string 15.
44	D15	**Drain Sense Input 15** Drain sense input for external MOSFET 15. Connect D15 through a 10MΩ resistor to the drain of the external MOSFET driving LED string 15.
45	VCC	**5V internal LDO regulator output** VCC powers the FBO outputs. Bypass VCC to ground with a 4.7µF ceramic capacitor placed close to VCC.
46	PHI	**Phase synchronization input** Drive PHI with an external signal from 40Hz to 10khz kHz to synchronize the MSL2162 clock. In TV applications drive PHI with the VSYNC signal.
47	GSC	**Gate shift clock input** Drive GSC with the gate shift clock of the video signal, from 0 to 10khz MHz. In TV applications drive GSC with the HSYNC signal.
48	PWM	**PWM input** PWM allows external control of the brightness of all LED strings. Drive PWM with a pulse-width modulated signal with duty ratio ranging from 0% to 100% and frequency up to 5kHz. When not configured as an input, PWM is high impedance.

NO.	NAME	DESCRIPTION
49	EN	**Enable input (active high)** Drive EN high to turn on the MSL2162, drive EN low to turn off the MSL2162. For automatic start-up, connect EN to VIN. When EN is low, the entire device, including the serial interface, is turned off. Drive EN high to initiate a boot load of the EEPROM data into the control registers to set the startup condtions.
50	VIN	**Supply voltage input** Connect a 12V ±10% supply to VIN. Bypass VIN to ground with a 10µF ceramic capacitor placed close to VIN.
51	VDD	**2.5V internal LDO regulator output** VDD powers internal logic. Bypass VDD to ground with a 4.7µF ceramic capacitor placed close to VDD.
52	S0	**Current sense input 0** Current sense input for LED string 0. Connect S0 to the source of the external MOSFET and to the current sense resistor for LED string 0. The full-scale LED current threshold is 500mV is across the current sense resistor.
53	G0	**Gate output 0** Gate drive output for external MOSFET 0. Connect G0 to the gate of the external MOSFET driving LED string 0.
54	D0	**Drain sense input 0** Drain sense input for external MOSFET 0. Connect D0 through a 10MΩ resistor to the drain of the external MOSFET driving LED string 0.
55	S1	**Current sense input 1** Current sense input for LED string 1. Connect S1 to the source of the external MOSFET and to the current sense resistor for LED string 1. The full-scale LED current threshold is 500mV is across the current sense resistor.
56	G1	**Gate output 1** Gate drive output for external MOSFET 1. Connect G1 to the gate of the external MOSFET driving LED string 1.
57	D1	**Drain sense input 1** Drain sense input for external MOSFET 1. Connect D1 through a 10MΩ resistor to the drain of the external MOSFET driving LED string 1.
58	S2	**Current sense input 2** Current sense input for LED string 2. Connect S2 to the source of the external MOSFET and to the current sense resistor for LED string 2. The full-scale LED current threshold is 500mV is across the current sense resistor.
59	G2	**Gate output 2** Gate drive output for external MOSFET 2. Connect G2 to the gate of the external MOSFET driving LED string 2.
60	D2	**Drain sense input 2** Drain sense input for external MOSFET 2. Connect D2 through a 10MΩ resistor to the drain of the external MOSFET driving LED string 2.

NO.	NAME	DESCRIPTION
61	S3	**Current sense input 3** Current sense input for LED string 3. Connect S3 to the source of the external MOSFET and to the current sense resistor for LED string 3. The full-scale LED current threshold is 500mV is across the current sense resistor.
62	G3	**Gate output 3** Gate drive output for external MOSFET 3. Connect G3 to the gate of the external MOSFET driving LED string 3.
63	D3	**Drain sense input 3** Drain sense input for external MOSFET 3. Connect D3 through a 10MΩ resistor to the drain of the external MOSFET driving LED string 3.
64	S4	**Current sense input 4** Current sense input for LED string 4. Connect S4 to the source of the external MOSFET and to the current sense resistor for LED string 4. The full-scale LED current threshold is 500mV is across the current sense resistor.
EP	EP	**Exposed pad, power ground** Connect EP to system ground using short, wide traces. EP is also the thermal relief pad for the device.

Absolute Maximum Ratings

Voltage (With Respect to ground)

VIN, EN, D0 – D15, G0 – G15 .... −0.3V to +16V

VDD, ADDR, S0 – S15 .... −0.3V to +2.75V

FBO1, FBO2, FBI1, FLTB, PHI, GSC, PWM.. −0.3V to +5.5V

VCC .... −0.3V to +6V

MISO, MOSI, CSB, SCK .... −0.3V to +5.5V

Current (Into Pin)

VIN 50mA

FBO1, FBO2 .... +0µA to −800µA

G0 – G15 .... ±100mA

All other pins 20mA

Continuous Power Dissipation

64–Pin 9mm x 9mm QFN (derate 38mW/°C above T_A = +70°C) 2100mW

Ambient Operating Temperature Range T_A = T_{MIN} to T_{MAX}... −40°C to +105°C

Junction Temperature .... +125°C

Storage Temperature Range .... −65°C to +125°C

Lead Soldering Temperature, 10s .... +300°C

16-string White and RGB LED Driver with
Adaptive Configuration, EEPROM, and SPI Bus

Detailed Description

The MSL2162 is a highly integrated, flexible, multi-string LED driver. It drives external MOSFETs to allow high LED string currents, and includes power supply control to maximize efficiency. The driver optionally connects to a video subsystem to offer a simple architecture for use in LCD TV backlight applications. Up to eight devices easily connect together to drive large numbers of LED strings in a system. The driver provides multiple methods of controlling LED brightness, through both peak current control and through pulse width control of the string drive signals. Peak current control offers excellent color consistency, while pulse width control allows brightness management. An on-chip E²PROM holds all the default control register values. At power-up the data in the E²PROM automatically copy directly to the control registers, setting up the device for operation. The factory programmed E²PROM values are changed using the serial interface when a different power-up condition is desired.

The device interfaces to a microcontroller using an SPI compatible serial interface. The 20MHz SPI compatible interface supports up to eight devices per Chip Select line. While typically the LED drive PWM signal is internally generated, the driver also accepts an external direct PWM drive signal applied to the PWM input that sets the PWM duty and the frequency of the string drive signals. The MSL2162 also allows phase spreading when external PWM direct drive is used. With phase spreading enabled, a progressive 1/16 phase delay per string helps reduce both the transient load on the LED power supplies, and the power supply input capacitor size requirements.

The PWM frequency of the drivers is either synchronized to an external signal applied to PHI, or generated from the internal oscillator for stand-alone applications. Typically the VSYNC signal from the video system is used for the PHI input. A frequency multiplier (1x to 32x) processes this signal for use by the internal PWM engine. The on-time of each string is individually programmed via the device registers, providing a peak resolution of 12-bits when using the on-chip PWM generator. The actual resolution of the PWM frequency

depends upon on the ratio of the GSC frequency (typically provided by a systems HSYNC signal, but can be internally generated) to the PHI frequency, because the on-time of a string is programmed as a 12-bit count of the number of GSC clock cycles. This count can be further scaled by an 8-bit Global intensity value, when enabled. The GSC clock is also used to precisely set each string's phase delay so that it is synchronized to its physical position relative to the video frame.

The Efficiency Optimizers control a wide range of different architectures of external DC/DC and AC/DC converters. Multiple drivers in a system communicate with each other in real time to select an optimized operating voltage for the LEDs. This allows design of the power supply for the worst case Forward Voltage (V_f) of the LEDs without worrying about excessive power dissipation issues. During the start-up sequence the MSL2162 automatically reduces the power supply voltage to the minimum voltage required to keep the LEDs in current regulation. The devices can be configured to periodically perform this optimization to compensate for changes of the LED's forward voltage, and to assure continued optimum power savings.

Internal Regulators and Enable Input

The MSL2162 includes two internal linear regulators that provide VCC (5V) and VDD (2.5V) for internal circuitry. VIN (12V nominal) supplies the VCC and VDD regulators. Bypass VIN to ground with a 10µF capacitor close to the device. Bypass VCC to ground with a 4.7µF capacitor close to the device. Bypass VDD to ground with a 4.7µF capacitor close to the device.

The MSL2162 enable input, EN, enables the device. Drive EN low to enter low power operation, which lowers quiescent current draw to less than 20µA. With EN low the serial interface is ignored. Drive EN high to turn on the device. When EN is driven high the contents of the E²PROM are boot loaded into the control registers, simulating a cold start-up.

Setting the Maximum LED String Current with the Source Resistor

The maximum string current, I_{LEDn}, for each string is set by a shunt resistor connected to ground from the Source terminal of the string drive MOSFET. The feedback threshold is 500mV. Determine the resistor value using:

$$R_{Sn} = \frac{0.5}{I_{LEDn}} \, \Omega. \qquad .$$

For example, a full-scale LED current of 100mA returns $R_{Sn} = 5\Omega$. The current for all LED strings is reduced from full-scale value with 8-bit resolution using ISTR, the String Current Control register 0x31.

Connecting the Efficiency Optimizer to an LED String Power Supply and Selecting Resistors

The MSL2162 is designed to control LED string power supplies that use a voltage divider (R_{TOP} and R_{BOTTOM} in Figure 4) to set output voltage, and whose regulation feedback voltage is not more than 3.5V.
Figure 4. FBOn Connects to the Power Supply Voltage Divider Through a Diode

To select the resisters first determine $V_{OUT(MIN)}$ and $V_{OUT(MAX)}$, the minimum and maximum string supply voltage limits, using:

$$V_{OUT(MIN)} = \left(V_{f(MIN)} * [\#ofLEDs]\right) + 0.5 \, ,$$

and

$$V_{OUT(MAX)} = \left(V_{f(MAX)} * [\#ofLEDs]\right) + 0.5 \, ,$$

where $V_{f(MIN)}$ and $V_{f(MAX)}$ are the LED's minimum and maximum forward voltage drops at the peak current set by R_{Sn} (page 10). For example, if the LED data are $V_{f(MIN)} = 3.5V$ and $V_{f(MAX)} = 3.8V$, and ten LEDs are used in a string, then the total minimum and maximum voltage drop across a string is 35V and 38V. Adding an allowance of 0.5V of for the string drive MOSFET headroom brings $V_{OUT(MIN)}$ to 35.5V and $V_{OUT(MAX)}$ to 38.5V. Then determine R_{TOP} using:

$$R_{TOP} = \frac{V_{OUT(MAX)} - V_{OUT(MIN)}}{I_{FBOn(MAX)}} \, ,$$

where $I_{FBOn(MAX)}$ is the 255µA maximum output current of the Efficiency Optimizer outputs FBOn. Finally, determine R_{BOTTOM} using:

$$R_{BOTTOM} = R_{TOP} * \frac{V_{FB}}{V_{OUT(MAX)} - V_{FB}} \, ,$$

where V_{FB} is the regulation feedback voltage of the power supply. Place a diode (1N4148 or similar) between FBO and the supply's feedback node to protect the MSL2162 against current flow into FBOn. Assign all strings powered by a common supply to the proper FBO output using String Set registers 0x40 – 0x5F; default assignments are presented in Table 5.

Once configured, determine the change in power supply output voltage in response to a change in FBO output current using:

$$\Delta V_{OUT} = \Delta I_{FBO} * R_{TOP} \, .$$

Using Multiple Atmel LED Driver-MSL2162s to Control a Common Power Supply

Multiple MSL2162s connect in a chain configuration to control a single string power supply (Figure 5) when driving more than 16 LED stings. Cascade multiple devices with the FBI1 of one device connected to the FBO1 of the next. Connect the first FBO1 to the power supply feedback resistor node through a diode, and the unused FBI1 input to ground as close to the MSL2162 as possible. Assure that all strings powered by the common supply are assigned to FBO1 using String Set registers (STRnSET) 0x40 - 0x5F (FBO1 is the power-up default setting for all strings). The chained devices work together to ensure that the system operates at optimum efficiency. Note that the accuracy of the feedback chain may degrade through each link of the FBI1/FBO1 chain by as much as 2%. Determine the potential worst case maximum FBO1 current $I_{FBOn(MAX/MIN)}$ using:

$$I_{FBOn(MAX/MIN)} = 255\mu A * (0.98)^{N-1} \, ,$$

where N is the number of MSL2162s connected in series. Use this result in the above R_{TOP} resistor equation for the term $I_{FBOn(MAX)}$ instead of using 255µA.

Take care in laying out the traces for the Efficiency Optimizer connections. Minimize the FBI1/FBO1 trace lengths as much as possible. Do not route the signals close to traces with large variations in voltage or current, because noise may couple into FBI1. If these traces must be routed near noisy signals, shield them from noise by using ground planes or guard traces. Note that Figure 5 also shows the connections for an unused string.

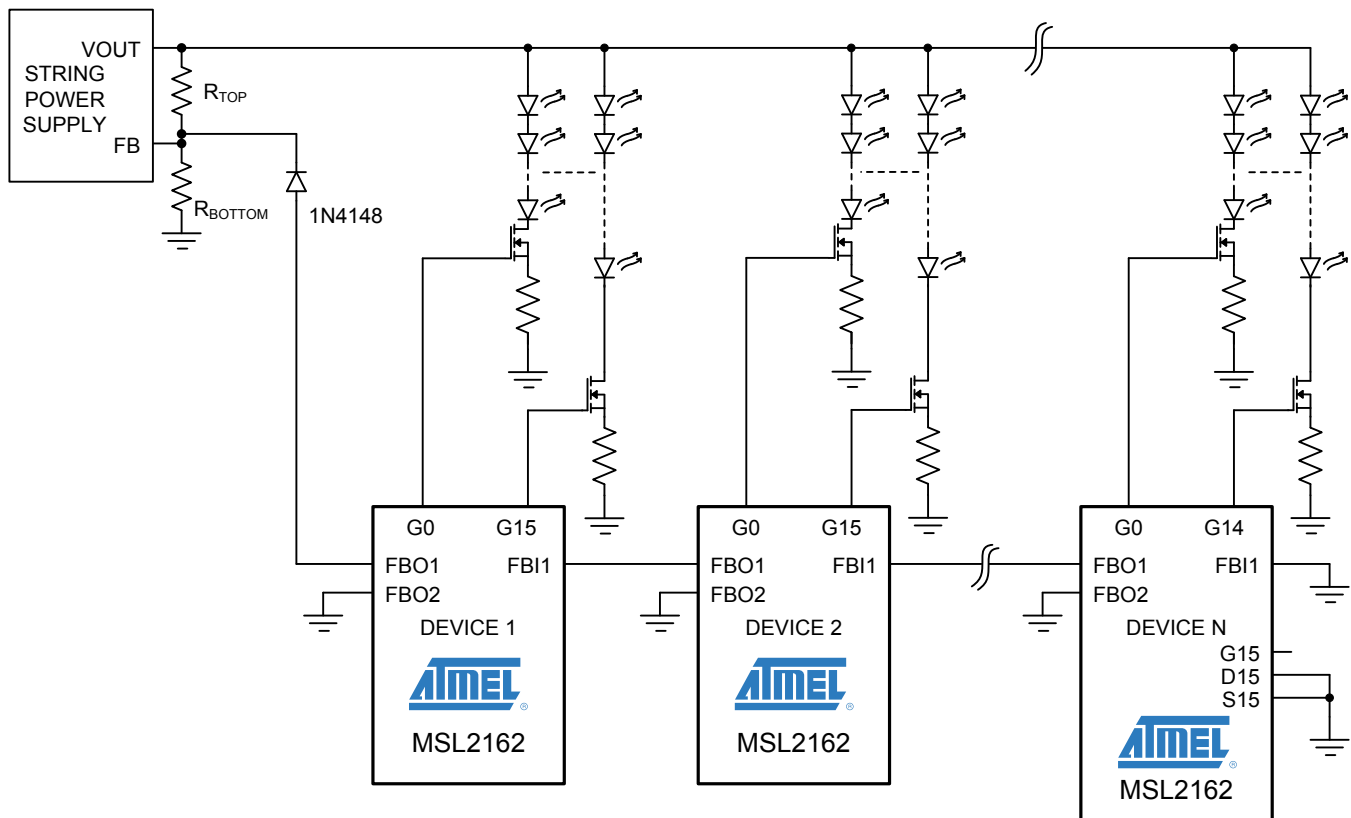

Figure 5. Example of Cascading Multiple Devices to Optimize a Common String Power Supply

Direct PWM Control of the LED Strings

An external PWM signal applied to the PWM input allows direct PWM control over the strings when bits PWMEN and PWMDIRECT (bits D0 and D1 in PWM Control register 0x2D) are set to 1. This configuration bypasses PHI and GSC, but allows LED string phase delay via the Phase Delay Enable bit PHADLYEN (bit D0 of register 0x2E). With phase delay enabled, a progressive delay of 1/16 the PWM frame is calculated and applied successively to each string drive signal.

Register Map and the E²PROM

Register Map Summary

Control the MSL2162 using the registers in the range 0x00 - 0xBF (Table 4). Two additional registers, 0xC0 and 0xC1, allow access to, and programming of, the E²PROM. The power-up default values for all control registers (Table 5) are stored within the on-chip E²PROM, and any of these E²PROM values may be changed through the serial interface
