

# DDR3 SDRAM UDIMM

## MT9JSF12872A – 1GB

For component data sheets, refer to Micron's Web site: [www.micron.com](http://www.micron.com)

### Features

- DDR3 functionality and operations supported as per the component data sheet
- 240-pin, unbuffered dual in-line memory module (UDIMM)
- Fast data transfer rates: PC3-10600, PC3-8500, or PC3-6400
- 1GB (128 Meg x 72)
- $V_{DD} = 1.5V \pm 0.075V$
- $V_{DDSPD} = +3.0V$  to  $+3.6V$
- Supports ECC error detection and correction
- Nominal and dynamic on-die termination (ODT) for data, strobe, and mask signals
- Single rank
- On-board I<sup>2</sup>C temperature sensor with integrated serial presence-detect (SPD) EEPROM
- 8 internal device banks
- Fixed burst chop (BC) of 4 and burst length (BL) of 8 via the mode register set (MRS)
- Selectable BC4 or BL8 on-the-fly (OTF)
- Gold edge contacts
- Pb-free
- Fly-by topology
- Terminated control, command, and address bus

Figure 1: 240-Pin UDIMM (MO-269 R/C D)

PCB height: 30.0mm (1.181in)

### Options

- Operating temperature<sup>1</sup>
  - Commercial ( $0^{\circ}C \leq T_A \leq +70^{\circ}C$ )
  - Industrial ( $-40^{\circ}C \leq T_A \leq +85^{\circ}C$ )
- Package
  - 240-pin DIMM
- Frequency/CAS latency
  - 1.5ns @ CL = 8 (DDR3-1333)
  - 1.5ns @ CL = 9 (DDR3-1333)
  - 1.5ns @ CL = 10 (DDR3-1333)<sup>2</sup>
  - 1.87ns @ CL = 7 (DDR3-1066)
  - 1.87ns @ CL = 8 (DDR3-1066)
  - 2.5ns @ CL = 5 (DDR3-800)<sup>2</sup>
  - 2.5ns @ CL = 6 (DDR3-800)<sup>2</sup>

### Marking

None

**Table 5: Pin Descriptions**

Symbol	Type	Description
A[13:0]	Input	<b>Address inputs:</b> Provide the row address for ACTIVATE commands, and the column address and auto precharge bit (A10) for READ/WRITE commands, to select one location out of the memory array in the respective bank. A10 is sampled during a PRECHARGE command to determine whether the PRECHARGE applies to one bank (A10 LOW, bank selected by BA[2:0]) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by BA. A12 is also used for BC4/BL8 identification as “BL on-the-fly” during CAS commands. The address inputs also provide the op-code during the mode register command set. A[13:0] address the 1Gb DDR3 devices.
BA[2:0]	Input	<b>Bank address inputs:</b> BA[2:0] define the device bank to which an ACTIVATE, READ, WRITE, or PRECHARGE command is being applied. BA[2:0] define which mode register (MR0, MR1, MR2, and MR3) is loaded during the LOAD MODE command.
CK0, CK0#	Input	<b>Clock:</b> CK and CK# are differential clock inputs. All control, command, and address input signals are sampled on the crossing of the positive edge of CK and the negative edge of CK#. Output data (DQ, DQS, and DQS#) is referenced to the crossings of CK and CK#.
CKE0	Input	<b>Clock enable:</b> CKE enables (registered HIGH) and disables (registered LOW) internal circuitry and clocks on the DRAM.
DM[8:0]	Input	<b>Input data mask:</b> DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH, along with the input data, during a write access. DM is sampled on both edges of the DQS. Although the DM pins are input-only, the DM loading is designed to match that of the DQ and DQS pins.
ODT0	Input	<b>On-die termination:</b> ODT enables (registered HIGH) and disables (registered LOW) termination resistance internal to the DDR3 SDRAM. When enabled in normal operation, ODT is only applied to the following pins: DQ, DQS, DQS#, and DM. The ODT input will be ignored if disabled via the LOAD MODE command.
RAS#, CAS#, WE#	Input	<b>Command inputs:</b> RAS#, CAS#, and WE# (along with S#) define the command being entered.
RESET#	Input (LVCMOS)	<b>Reset:</b> RESET# is an active LOW CMOS input referenced to Vss. The RESET# input receiver is a CMOS input defined as a rail-to-rail signal with DC HIGH $\geq 0.8 \times V_{DDQ}$ and DC LOW $\leq 0.2 \times V_{DDQ}$ . RESET# assertion and deassertion are asynchronous. System applications will most likely be unterminated, heavily loaded, and have very slow slew rates. A slow slew rate receiver design is recommended along with implementing on-chip noise filtering to prevent false triggering (RESET# assertion minimum pulse width is 100ns).
S0#	Input	<b>Chip select:</b> S# enables (registered LOW) and disables (registered HIGH) the command decoder.
SA[2:0]	Input	<b>Serial address inputs:</b> These pins are used to configure the temperature sensor/SPD EEPROM address range on the I <sup>2</sup> C bus.
SCL	Input	<b>Serial clock for temperature sensor/SPD EEPROM:</b> SCL is used to synchronize the communication to and from the temperature sensor/SPD EEPROM.
CB[7:0]	I/O	<b>Check bits:</b> Data used for ECC.
DQ[63:0]	I/O	<b>Data input/output:</b> Bidirectional data bus.
DQS[8:0], DQS#[8:0]	I/O	<b>Data strobe:</b> DQS and DQS# are differential data strobes. Output with read data. Edge-aligned with read data. Input with write data. Center-aligned with write data.
SDA	I/O	<b>Serial data:</b> SDA is a bidirectional pin used to transfer addresses and data into and out of the temperature sensor/SPD EEPROM on the module on the I <sup>2</sup> C bus.
EVENT#	Output (open drain)	<b>Temperature event:</b> The EVENT# pin is asserted by the temperature sensor when critical temperature thresholds have been exceeded.
VDD	Supply	<b>Power supply:</b> 1.5V $\pm$ 0.075V. The component VDD and VDDQ are connected to the module VDD.
VDDSPD	Supply	<b>Temperature sensor/SPD EEPROM power supply:</b> +3.0V to +3.6V.

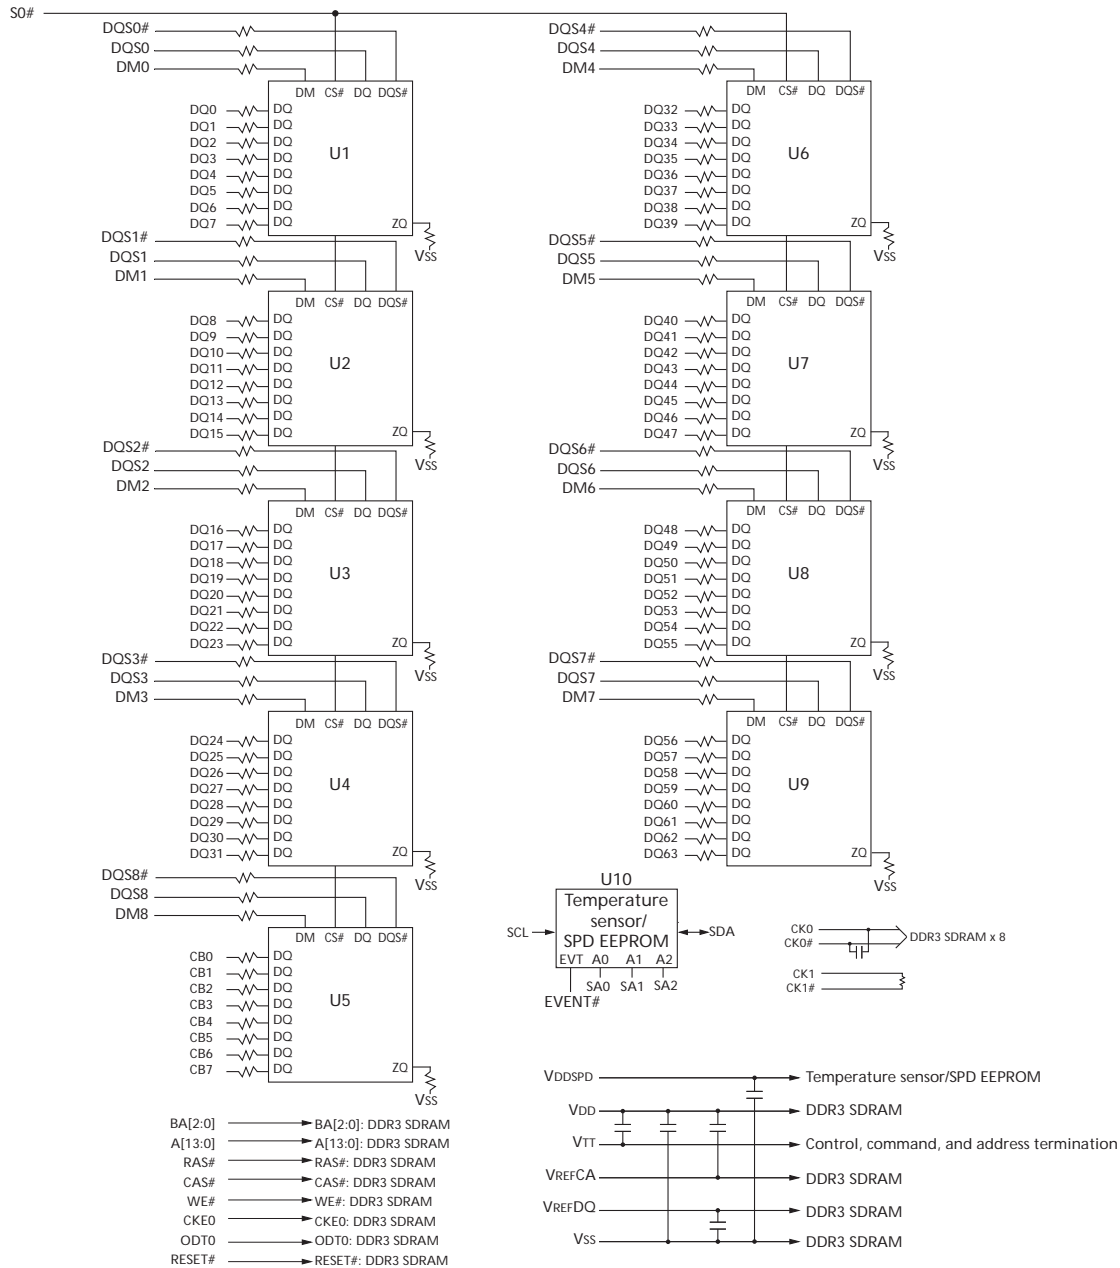

Table 5: Pin Descriptions (continued)

Symbol	Type	Description
VREFCA	Supply	<b>Reference voltage:</b> Control, command, and address (V <sub>DD</sub> /2).
VREFDQ	Supply	<b>Reference voltage:</b> DQ, DM (V <sub>DD</sub> /2).
VSS	Supply	Ground.
VTT	Supply	<b>Termination voltage:</b> Used for control, command, and address (V <sub>DD</sub> /2).
NC	-	<b>No connect:</b> These pins are not connected on the module.

## Functional Block Diagram

Figure 2: Functional Block Diagram

- Notes: 1. The ZQ ball on each DDR3 component is connected to an external  $240\Omega \pm 1$  percent resistor that is tied to ground. It is used for the calibration of the component's ODT and output driver.

## General Description

The MT9JSF12872A DDR3 SDRAM module is a high-speed, CMOS dynamic random access 1GB memory module organized in a x72 configuration. This DDR3 SDRAM module uses internally configured, 8-bank 1Gb DDR3 SDRAM devices.

DDR3 SDRAM modules use double data rate architecture to achieve high-speed operation. The double data rate architecture is essentially an  $8n$ -prefetch architecture with an interface designed to transfer two data words per clock cycle at the I/O pins. A single read or write access for the DDR3 SDRAM module effectively consists of a single  $8n$ -bit-wide, one-clock-cycle data transfer at the internal DRAM core and eight corresponding  $n$ -bit-wide, one-half-clock-cycle data transfers at the I/O pins.

The differential data strobe (DQS, DQS#) is transmitted externally, along with data, for use in data capture at the DDR3 SDRAM input receiver. DQS is center-aligned with data for WRITES. The read data is transmitted by the DDR3 SDRAM and edge-aligned to the data strobes.

DDR3 SDRAM modules operate from a differential clock (CK and CK#); the crossing of CK going HIGH and CK# going LOW will be referred to as the positive edge of CK. Control, command, and address signals are registered at every positive edge of CK. Input data is registered on both edges of DQS, and output data is referenced to both edges of DQS, as well as to both edges of CK.

## Fly-By Topology

These DDR3 modules use faster clock speeds than earlier DDR technologies, making signal quality more important than ever. For improved signal quality, the clock, control, command, and address buses have been routed in a fly-by topology, where each clock, control, command, and address pin on each DRAM is connected to a single trace and terminated (rather than a tree structure, where the termination is off the module near the connector). Inherent to fly-by topology, the timing skew between the clock and DQS signals can be easily accounted for by using the write-leveling feature of DDR3.

## Temperature Sensor with Serial Presence-Detect EEPROM

### Thermal Sensor Operations

The temperature from the integrated thermal sensor is monitored and converted into a digital word via the I<sup>2</sup>C bus. System designers can use the user-programmable registers to create a custom temperature-sensing solution based on system requirements. Programming and configuration details comply with JEDEC Standard No. 21-C, page 4.7-1, "Mobile Platform Memory Module Thermal Sensor Component Specification."

### Serial Presence-Detect EEPROM Operation

DDR3 SDRAM modules incorporate serial presence-detect. The SPD data is stored in a 256-byte EEPROM. The first 128 bytes are programmed by Micron to comply with JEDEC specification JC-45 "Appendix X: Serial Presence Detect (SPD) for DDR3 SDRAM Modules" (pending approval). These bytes identify module-specific timing parameters, configuration information, and physical attributes. User-specific information can be written into the remaining 128 bytes of storage. System READ/WRITE operations between the master (system logic) and the slave EEPROM device occur via a standard I<sup>2</sup>C bus using the DIMM's SCL (clock) and SDA (data) signals, together with SA[2:0], which provide eight unique DIMM/EEPROM addresses. Write protect (WP) is connected to VSS, permanently disabling hardware write protect.

## Electrical Specifications

Stresses greater than those listed in Table 6 may cause permanent damage to the module. This is a stress rating only, and functional operation of the module at these or any other conditions outside those indicated in each device's data sheet is not implied. Exposure to absolute maximum rating conditions for extended periods may adversely affect reliability.

**Table 6: Absolute Maximum Ratings**

Symbol	Parameter	Min	Max	Units
V <sub>DD</sub>	V <sub>DD</sub> supply voltage relative to V <sub>SS</sub>	-0.4	+1.975	V
V <sub>IN</sub> , V <sub>OUT</sub>	Voltage on any pin relative to V <sub>SS</sub>	-0.4	+1.975	V

**Table 7: Operating Conditions**

Symbol	Parameter	Min	Nom	Max	Units	Notes	
V <sub>DD</sub>	V <sub>DD</sub> supply voltage	1.425	1.5	1.575	V		
I <sub>VTT</sub>	Termination reference current from V <sub>TT</sub>	-600	-	+600	mA		
V <sub>TT</sub>	Termination reference voltage (DC) – command/address bus	0.49 × V <sub>DD</sub> - 20mV	0.5 × V <sub>DD</sub>	0.51 × V <sub>DD</sub> + 20mV	V	1	
I <sub>I</sub>	Input leakage current; Any input 0V ≤ V <sub>IN</sub> ≤ V <sub>DD</sub> ; V <sub>REF</sub> input 0V ≤ V <sub>IN</sub> ≤ 0.95V (All other pins not under test = 0V)	-32	0	+32	μA		
	Address inputs, RAS#, CAS#, WE#, BA						
	S#, CKE, ODT, CK, CK#	-16	0	+16			
I <sub>OZ</sub>	Output leakage current; 0V ≤ V <sub>OUT</sub> ≤ V <sub>DDQ</sub> ; DQ and ODT are disabled; ODT is HIGH	-5	0	+5	μA		
I <sub>VREF</sub>	V <sub>REF</sub> supply leakage current; V <sub>REFDQ</sub> = V <sub>DD</sub> /2 or V <sub>REFCA</sub> = V <sub>DD</sub> /2 (All other pins not under test = 0V)	-9	0	+9	μA		
T <sub>A</sub>	Module ambient operating temperature	Commercial Industrial	0 -40	- -	+70 +85	°C	2, 3
T <sub>C</sub>	DDR3 SDRAM component case operating temperature	Commercial Industrial	0 -40	- -	+85 +95	°C	2, 3, 4

- Notes:
1. V<sub>TT</sub> termination voltage in excess of the stated limit will adversely affect the command and address signals' voltage margin and will reduce timing margins.
  2. T<sub>A</sub> and T<sub>C</sub> are simultaneous requirements.
  3. For further information, refer to technical note TN-00-08: "Thermal Applications," available on Micron's Web site.
  4. The refresh rate is required to double when 85°C < T<sub>C</sub> ≤ 95°C.

## DRAM Operating Conditions

Recommended AC operating conditions are given in the DDR3 component data sheets. Component specifications are available on Micron's Web site. Module speed grades correlate with component speed grades, as shown in Table 8.

**Table 8: Module and Component Speed Grades**  
DDR3 components may exceed the listed module speed grades

Module Speed Grade	Component Speed Grade
-1G5	-15F
-1G4	-15E
-1G3	-15
-1G1	-187E
-1G0	-187
-80C	-25E
-80B	-25

## Design Considerations

### Simulations

Micron memory modules are designed to optimize signal integrity through carefully designed terminations, controlled board impedances, routing topologies, trace length matching, and decoupling. However, good signal integrity starts at the system level. Micron encourages designers to simulate the signal characteristics of the system's memory bus to ensure adequate signal integrity of the entire memory system.

### Power

Operating voltages are specified at the DRAM, not at the edge connector of the module. Designers must account for any system voltage drops at anticipated power levels to ensure the required supply voltage is maintained.

## IDD Specifications

**Table 9: DDR3 IDD Specifications and Conditions – 1GB**

Values are for the MT41J128M8 DDR3 SDRAM only and are computed from values specified in the 1Gb (128 Meg x 8) component data sheet

Parameter	Symbol	1333	1066	800	Units
Operating current 0: One bank ACTIVATE-to-PRECHARGE	IDD0	990	900	810	mA
Operating current 1: One bank ACTIVATE-to-READ-to-PRECHARGE	IDD1	1,170	990	990	mA
Precharge power-down current: Slow exit	IDD2P	225	225	225	mA
Precharge power-down current: Fast exit	IDD2P	90	90	90	mA
Precharge quiet standby current	IDD2Q	450	405	360	mA
Precharge standby current	IDD2N	495	450	405	mA
Active power-down current	IDD3P	315	270	225	mA
Active standby current	IDD3N	540	495	450	mA
Burst read operating current	IDD4R	1,800	1,440	1,170	mA
Burst write operating current	IDD4W	1,710	1,440	1,170	mA
Refresh current	IDD5B	2,160	1,980	1,800	mA
Self refresh temperature current: MAX T <sub>C</sub> = 85°C	IDD6	54	54	54	mA
Self refresh temperature current (SRT-enabled): MAX T <sub>C</sub> = 95°C	IDD6ET	81	81	81	mA
All banks interleaved read current	IDD7	4,410	3,510	3,150	mA

## Temperature Sensor with Serial Presence-Detect EEPROM

The temperature sensor continuously monitors the module's temperature and can be read back at any time over the I<sup>2</sup>C bus shared with the SPD EEPROM.

**Table 10: Temperature Sensor with Serial Presence-Detect EEPROM Operating Conditions**

Parameter/Condition	Symbol	Min	Max	Units
Supply voltage	V <sub>DDSPD</sub>	+3.0	+3.6	V
Supply current: V <sub>DD</sub> = 3.3V	I <sub>DD</sub>	–	+2.0	mA
Input high voltage: Logic 1; SCL, SDA	V <sub>IH</sub>	+1.45	V <sub>DDSPD</sub> + 1	V
Input low voltage: Logic 0; SCL, SDA	V <sub>IL</sub>	–	+0.55	V
Output low voltage: I <sub>OUT</sub> = 2.1mA	V <sub>OL</sub>	–	+0.4	V
Input current	I <sub>IN</sub>	–5.0	+5.0	μA
Temperature sensing range	–	–40	+125	°C
Temperature sensor accuracy (initial release)	–	–2.0	+2.0	°C
Temperature sensor accuracy	–	–1.0	+1.0	°C

**Table 11: Sensor and EEPROM Serial Interface Timing**

Parameter/Condition	Symbol	Min	Max	Units
Time bus must be free before a new transition can start	t <sub>BUF</sub>	4.7	–	μs
SDA fall time	t <sub>F</sub>	20	300	ns
SDA rise time	t <sub>R</sub>	–	1,000	ns
Data hold time	t <sub>HD:DAT</sub>	200	900	ns
Start condition hold time	t <sub>H:STA</sub>	4.0	–	μs
Clock HIGH period	t <sub>HIGH</sub>	4.0	50	μs
Clock LOW period	t <sub>LOW</sub>	4.7	–	μs
SCL clock frequency	f <sub>SCL</sub>	10	100	kHz
Data setup time	t <sub>SU:DAT</sub>	250	–	ns
Start condition setup time	t <sub>SU:STA</sub>	4.7	–	μs
Stop condition setup time	t <sub>SU:STO</sub>	4.0	–	μs

### EVENT# Pin

The temperature sensor also adds the EVENT# pin (open drain). Not used by the SPD EEPROM, EVENT# is a temperature sensor output used to flag critical events that can be set up in the sensor's configuration register.

EVENT# has three defined modes of operation: interrupt mode, compare mode, and critical temperature mode. The open-drain output of EVENT# under the three separate operating modes is illustrated in Figure 3 on page 13. Event thresholds are programmed in the 0x01 register using a hysteresis. The alarm window provides a comparison window, with upper and lower limits set in the alarm upper boundary register and the alarm lower boundary register, respectively. When the alarm window is enabled, EVENT# will trigger whenever the temperature is outside the MIN or MAX values set by the user.

The interrupt mode enables software to reset EVENT# after a critical temperature threshold has been detected. Threshold points are set in the configuration register by the user. This mode triggers the critical temperature limit and both the MIN and MAX of the temperature window.

The compare mode is similar to the interrupt mode, except EVENT# cannot be reset by the user and only returns to the logic HIGH state when the temperature falls below the programmed thresholds.

Critical temperature mode triggers EVENT# only when the temperature has exceeded the programmed critical trip point. When the critical trip point has been reached, the temperature sensor goes into comparator mode, and the critical EVENT# cannot be cleared through software.

### SM Bus Slave Subaddress Decoding

The temperature sensor's physical address differs from the SPD EEPROM's physical address: 0011 for A0, A1, A2, and RW# in binary where A2, A1, and A0 are the three slave subaddress pins and the RW# bit is the READ/WRITE flag.

If the slave base address is fixed for the temperature sensor/SPD EEPROM, then the pins set the subaddress bits of the slave address, enabling the devices to be located anywhere within the eight slave address locations. For example, they could be set from 30h to 3Eh.

Figure 3: EVENT# Pin Functionality

**Table 12: Temperature Sensor Registers**

Name	Address	Power-On Default
Pointer register	Not applicable	Undefined
Capability register	0x00	0x0001
Configuration register	0x01	0x0000
Alarm temperature upper boundary register	0x02	0x0000
Alarm temperature lower boundary register	0x03	0x0000
Critical temperature register	0x04	0x0000
Temperature register	0x05	Undefined

## Pointer Register

The pointer register selects which of the 16-bit registers is being accessed in subsequent READ and WRITE operations. This register is a write-only register.

**Table 13: Pointer Register Bits 0-7**

Bit							
7	6	5	4	3	2	1	0
0	0	0	0	Register select	Register select	Register select	Register select

**Table 14: Pointer Register Bits 0-2 Descriptions**

Bit			Register
2	1	0	
0	0	0	Capability register
0	0	1	Configuration register
0	1	0	Alarm temperature upper boundary register
0	1	1	Alarm temperature lower boundary register
1	0	0	Critical temperature register
1	0	1	Temperature register

## Capability Register

The capability register indicates the features and functionality supported by the temperature sensor. This register is a read-only register.

**Table 15: Capability Register (Address: 0x00)**

Bit							
15	14	13	12	11	10	9	8
RFU	RFU	RFU	RFU	RFU	RFU	RFU	RFU
Bit							
7	6	5	4	3	2	1	0
RFU	RFU	RFU	Temperature resolution		Wider range	Precision	Has alarm and critical temperature

**Table 16: Capability Register Bit Descriptions**

Bit	Description
0	Basic capability 1: Has alarm and critical trip point capabilities
1	Accuracy 0: $\pm 2^{\circ}\text{C}$ over the active range and $\pm 3^{\circ}\text{C}$ over the monitor range 1: $\pm 1^{\circ}\text{C}$ over the active range and $\pm 2^{\circ}\text{C}$ over the monitor range
2	Wider range 0: Temperatures lower than $0^{\circ}\text{C}$ are clamped to a binary value of 0 1: Temperatures below $0^{\circ}\text{C}$ can be read
4:3	Temperature resolution 00: $0.5^{\circ}\text{C}$ LSB 01: $0.25^{\circ}\text{C}$ LSB 10: $0.125^{\circ}\text{C}$ LSB 11: $0.0625^{\circ}\text{C}$ LSB
15:5	0: Must be set to zero

## Configuration Register

**Table 17: Configuration Register (Address: 0x01)**

Bit							
15	14	13	12	11	10	9	8
RFU	RFU	RFU	RFU	RFU	Hysteresis		Shutdown mode
Bit							
7	6	5	4	3	2	1	0
Critical lock bit	Alarm lock bit	Clear event	Event output status	Event output control	Critical event only	Event polarity	Event mode

**Table 18: Configuration Register Bit Descriptions**

Bit	Description	Notes
0	Event mode 0: Comparator mode 1: Interrupt mode	Event mode cannot be changed if either of the lock bits is set.
1	EVENT# polarity 0: Active LOW 1: Active HIGH	EVENT# polarity cannot be changed if either of the lock bits is set.
2	Critical event only 0: EVENT# trips on alarm or critical temperature event 1: EVENT# trips only if critical temperature is reached	
3	Event output control 0: Event output disabled 1: Event output enabled	
4	Event status 0: EVENT# has not been asserted by this device 1: EVENT# is being asserted due to an alarm window or critical temperature condition	This is a read-only field in the register. The event causing the event can be determined from the read temperature register.

Table 18: Configuration Register Bit Descriptions (continued)

Bit	Description	Notes
5	Clear event 0: No effect 1: Clears the event when the temperature sensor is in the interrupt mode	
6	Alarm window lock bit 0: Alarm trips are not locked and can be changed 1: Alarm trips are locked and cannot be changed	
7	Critical trip lock bit 0: Critical trip is not locked and can be changed 1: Critical trip is locked and cannot be changed	
8	Shutdown mode 0: Enabled 1: Shutdown	The shutdown mode is a power-saving mode that disables the temperature sensor.
10:9	Hysteresis enable 00: Disable 01: Enable at 1.5°C 10: Enable at 3°C 11: Enable at 6°C	<p>When enabled, a hysteresis is applied to temperature movement around the trip points. As an example, if the hysteresis register is enabled to a delta of 6°C, the preset trip points will toggle when the temperature reaches the programmed value. These values will reset when the temperature drops below the trip points minus the set hysteresis level; In this case, this would be critical temperature minus 6°C.</p> <p>The hysteresis is applied both to the above alarm window and the below alarm window bits found in the read-only temperature register. EVENT# is also affected by this register.</p>

Figure 4: Hysteresis

- Notes:
1.  $T_H$  is the value set in the alarm temperature upper boundary trip register.
  2.  $T_L$  is the value set in the alarm temperature lower boundary trip register.
  3. Hyst is the value set in the hysteresis bits of the configuration register.

Table 19: Hysteresis

Condition	Below Alarm Window Bit		Above Alarm Window Bit	
	Temperature Gradient	Critical Temperature	Temperature Gradient	Critical Temperature
Sets	Falling	$T_L - \text{Hyst}$	Rising	$T_H$
Clears	Rising	$T_L$	Falling	$T_H - \text{Hyst}$

## Temperature Format

The temperature trip point registers and temperature readout register use a “2’s complement” format to enable negative numbers. The least significant bit (LSB) is equal to 0.0625°C or 0.25°C depending on which register is referenced. As an example, assuming an LSB of 0.0625°C:

- A value of 0x018C would equal 24.75°C
- A value of 0x06C0 would equal 108°C
- A value of 0x1E74 would equal -24.75°C

## Temperature Trip Point Registers

The upper and lower temperature boundary registers are used to set the maximum and minimum values of the alarm window. LSB for these registers is 0.25°C. All RFU bits in the register will always report zero.

Table 20: Alarm Temperature Lower Boundary Register (Address: 0x02)

Bit															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	MSB										LSB	RFU	RFU
Alarm window upper boundary temperature															

Table 21: Alarm Temperature Lower Boundary Register (Address: 0x03)

Bit															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	MSB										LSB	RFU	RFU
Alarm window lower boundary temperature															

## Critical Temperature Register

The critical temperature register is used to set the maximum temperature above the alarm window. The LSB for this register is 0.25°C. All RFU bits in the register will always report zero.

Table 22: Critical Temperature Register (Address: 0x04)

Bit															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	MSB										LSB	RFU	RFU
Critical temperature trip point															

## Temperature Register

The temperature register is a read-only register that provides the current temperature detected by the temperature sensor. The LSB for this register is 0.0625°C with a resolution of 0.0625°C. The most significant bit (MSB) is 128°C in the readout section of this register.

The upper three bits of the register are used to monitor the trip points that are set in the previous three registers.

**Table 23: Temperature Register (Address: 0x05)**

Bit															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Above critical trip	Above alarm window	Below alarm window	MSB	Temperature											LSB

**Table 24: Temperature Register Bit Descriptions**

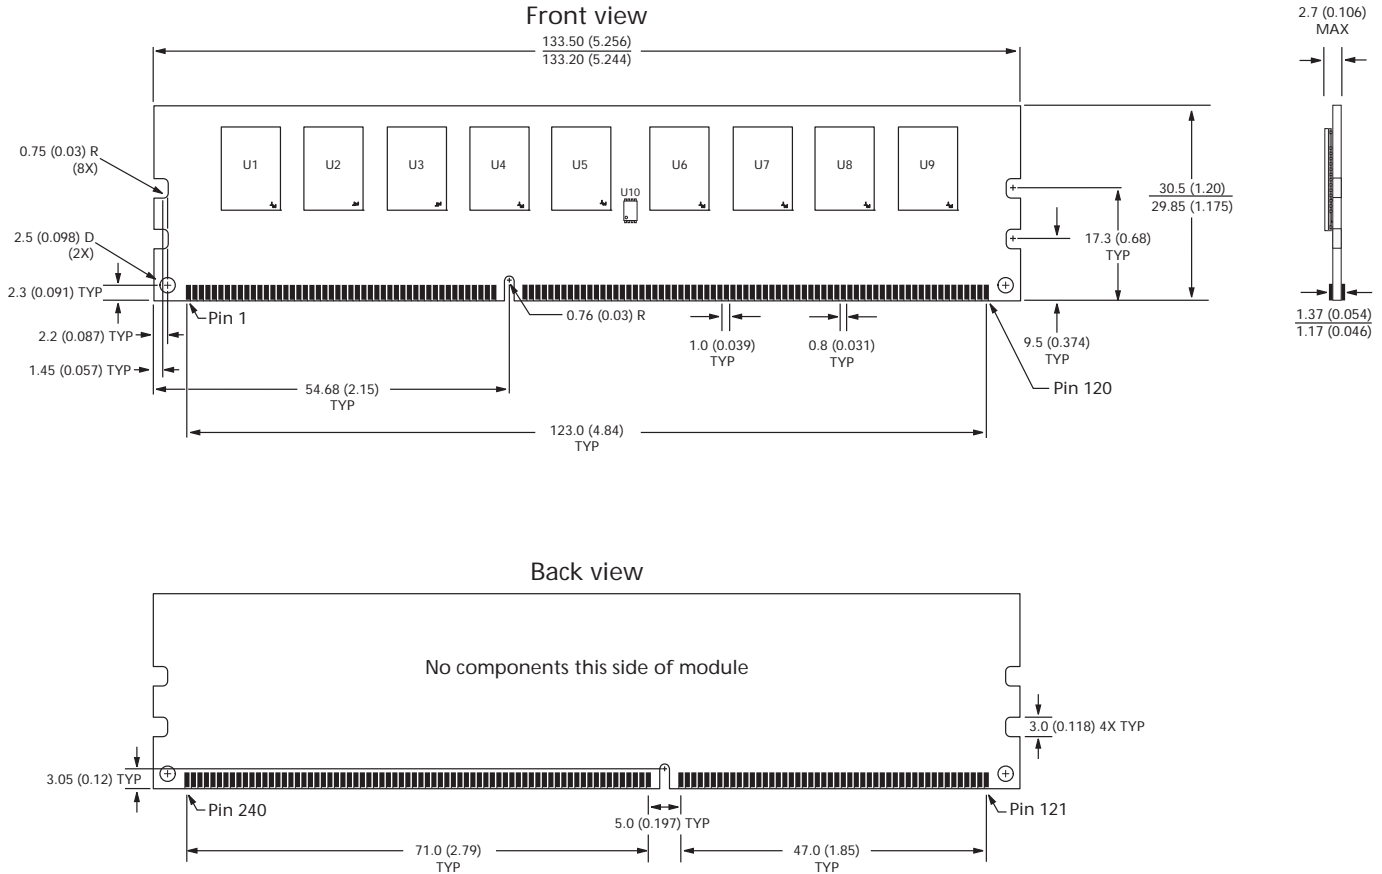

Bit	Description
13	Below alarm window 0: Temperature is equal to or above the lower boundary 1: Temperature is below alarm window
14	Above alarm window 0: Temperature is equal to or below the upper boundary 1: Temperature is above alarm window
15	Above critical trip point 0: Temperature is below critical trip point 1: Temperature is above critical trip point
